### CREDITS

The Department of Conservation thanks the USDA Natural Resources Conservation Service (formerly Soil Conservation Service) for providing modern soil survey maps and soil ratings. The Farmland Mapping and Monitoring Program relies on base information from the U.S. Geological Survey and the California Department of Water Resources for compilation of Important Farmland maps. Current air photos for the survey area have been provided by the High Altitude Missions Branch of NASA and private sector air photo libraries.

Data on areas participating in long term agricultural set aside programs is provided courtesy of the USDA Consolidated Farm Service Agency (formerly Agricultural Stabilization and Conservation Service); and on lands converted to wildlife habitat by the U.S. Fish and Wildlife Service, California Department of Fish and Game, and the Nature Conservancy.

The Department of Conservation also acknowledges the assistance it has received from map reviewers including county and city planning offices, county agricultural commissioners, Resource Conservation Districts, Natural Resources Conservation Service district conservationists, California Farm Bureau Federation, University of California Cooperative Extension, California Cattlemen's Association, local public interest groups, and building industry representatives. Many of these groups also participated in development of the Farmland of Local Importance definition for their respective counties.

## EXECUTIVE SUMMARY

---

The California Department of Conservation biennially maps agricultural and urban land use covering 42.8 million acres in California. This document represents the fifth biennial reporting cycle of the Farmland Mapping and Monitoring Program, and outlines the results for the 1992-94 period. Statewide, regional and individual county land use conversion statistics are contained in this report. Also reported are comparisons of conversion activities between the current 1992-94 period and the previous reporting period of 1990-92.

- The overall urbanization rate between 1992 and 1994 in the 47-county project area declined substantially from the previous reporting period. At the conclusion of the current reporting period there were 54,307 new acres of urban land, compared to 99,264 new acres in 1990-92, a decrease of 45 percent in the urbanization rate. A total of 15,098 acres (28 percent) of the new urban land came from irrigated farmland in 1992-94, down from 23,599 acres during 1990-92. The amount of urban land coming from marginal and nonirrigated land use categories was 39,209 acres.
- All regions in the state experienced a reduced rate of urbanization except the far northeast, where a very modest rise in new urban land occurred compared to 1990-92. The most significant drop in urbanization was in Southern California, where the number of new urban acres between 1992 and 1994 declined by almost 21,000 compared to 1990-92. The San Joaquin Valley, San Francisco Bay, and Sacramento Valley regions experienced 38 to 58 percent reductions in the growth of new urban land.
- For the current reporting period, the Southern California Region led the state with 25,972 new acres of urban land. Riverside County, at 8,435 acres, had the largest amount of new urban land compared to all other project counties, with San Bernardino and San Diego following at 4,710 acres and 4,463 acres, respectively. The San Joaquin Valley Region ranked second in the amount of new urban land with 13,398 acres, led by Kern County with 3,619 acres. Conversion of irrigated farmland accounted for 51 percent of new urban land in the San Joaquin Valley Region, and 17 percent of the new urban land in the Southern California Region.
- The total amount of irrigated farmland in the project area declined by 70,361 acres, or 0.8 percent, during 1992-1994, including the loss of nearly 44,000 acres of Prime Farmland. Loss of irrigated farmland was due to cessation of irrigation practice, conversion to wetland habitat, the creation of confined animal facilities (feedlots, poultry houses, etc.), and new rural residential housing and urban development. Large areas of Riverside, Kern and San

Benito counties were removed from the categories of irrigated farmland because they have remained unirrigated for at least six years.

- In all the regions mapped there was at least one county which had a gain in irrigated farmland. These increases, however, were generally of a small scale and usually offset by losses in nonirrigated land and grazing land. The regions experiencing the least amount of lost irrigated land were the Sierra Foothills Region with a net loss of 226 acres, and the San Francisco Bay Region with a net loss of 2,500 acres.
- Despite the reduction in the rate of statewide urbanization, there was a rise in the amount of agricultural land committed to future nonagricultural use. There were 38,892 acres of irrigated land identified as committed to nonagricultural use during the 1992-94 period, compared with 30,756 acres during 1990-92. Overall, there were 163,265 acres of various land uses committed to nonagricultural use in 1992-94, compared with 149,548 acres in 1990-92.

## **CHAPTER ONE**

---

### **INTRODUCTION**

#### **THE FARMLAND MAPPING AND MONITORING PROGRAM**

The goal of the Department of Conservation's Farmland Mapping and Monitoring Program (FMMP) is to provide land use conversion information for decision makers to use in their planning for the present and future of California's agricultural land resources. To meet this goal, the FMMP provides maps and statistical data to the public, academia, and local, state, and federal governments.

The FMMP was established in 1982 to continue the Important Farmland mapping efforts started in 1975 by the U.S. Department of Agriculture, Natural Resources Conservation Service (USDA-NRCS; formerly Soil Conservation Service). The intent of the USDA-NRCS was to produce agricultural resource maps based on soil quality and land use across the nation. As part of this mapping effort, a series of definitions known as the Land Inventory and Monitoring (LIM) criteria were developed. The LIM criteria classified the land's suitability for agricultural production based on physical and chemical characteristics of soils and actual land use. Important Farmland maps are derived from USDA-NRCS soil survey maps using LIM criteria.

The FMMP compiles two kinds of farmland maps: Important Farmland maps for those areas that have modern soil surveys, and Interim Farmland maps for those areas lacking modern soil survey information and for which there is expressed local concern on the status of farmland.

The first Farmland Conversion Report was released in 1988 and detailed farmland changes from 1984 to 1986 for 38 counties (30.3 million acres). Four subsequent reports have included additions to the project area as modern soil surveys became available. The present status of mapping, a total of 42.8 million acres in 47 counties, is shown in Figure 1.

Additional information related to the background of the Farmland Mapping and Monitoring Program can be found in Appendix C.

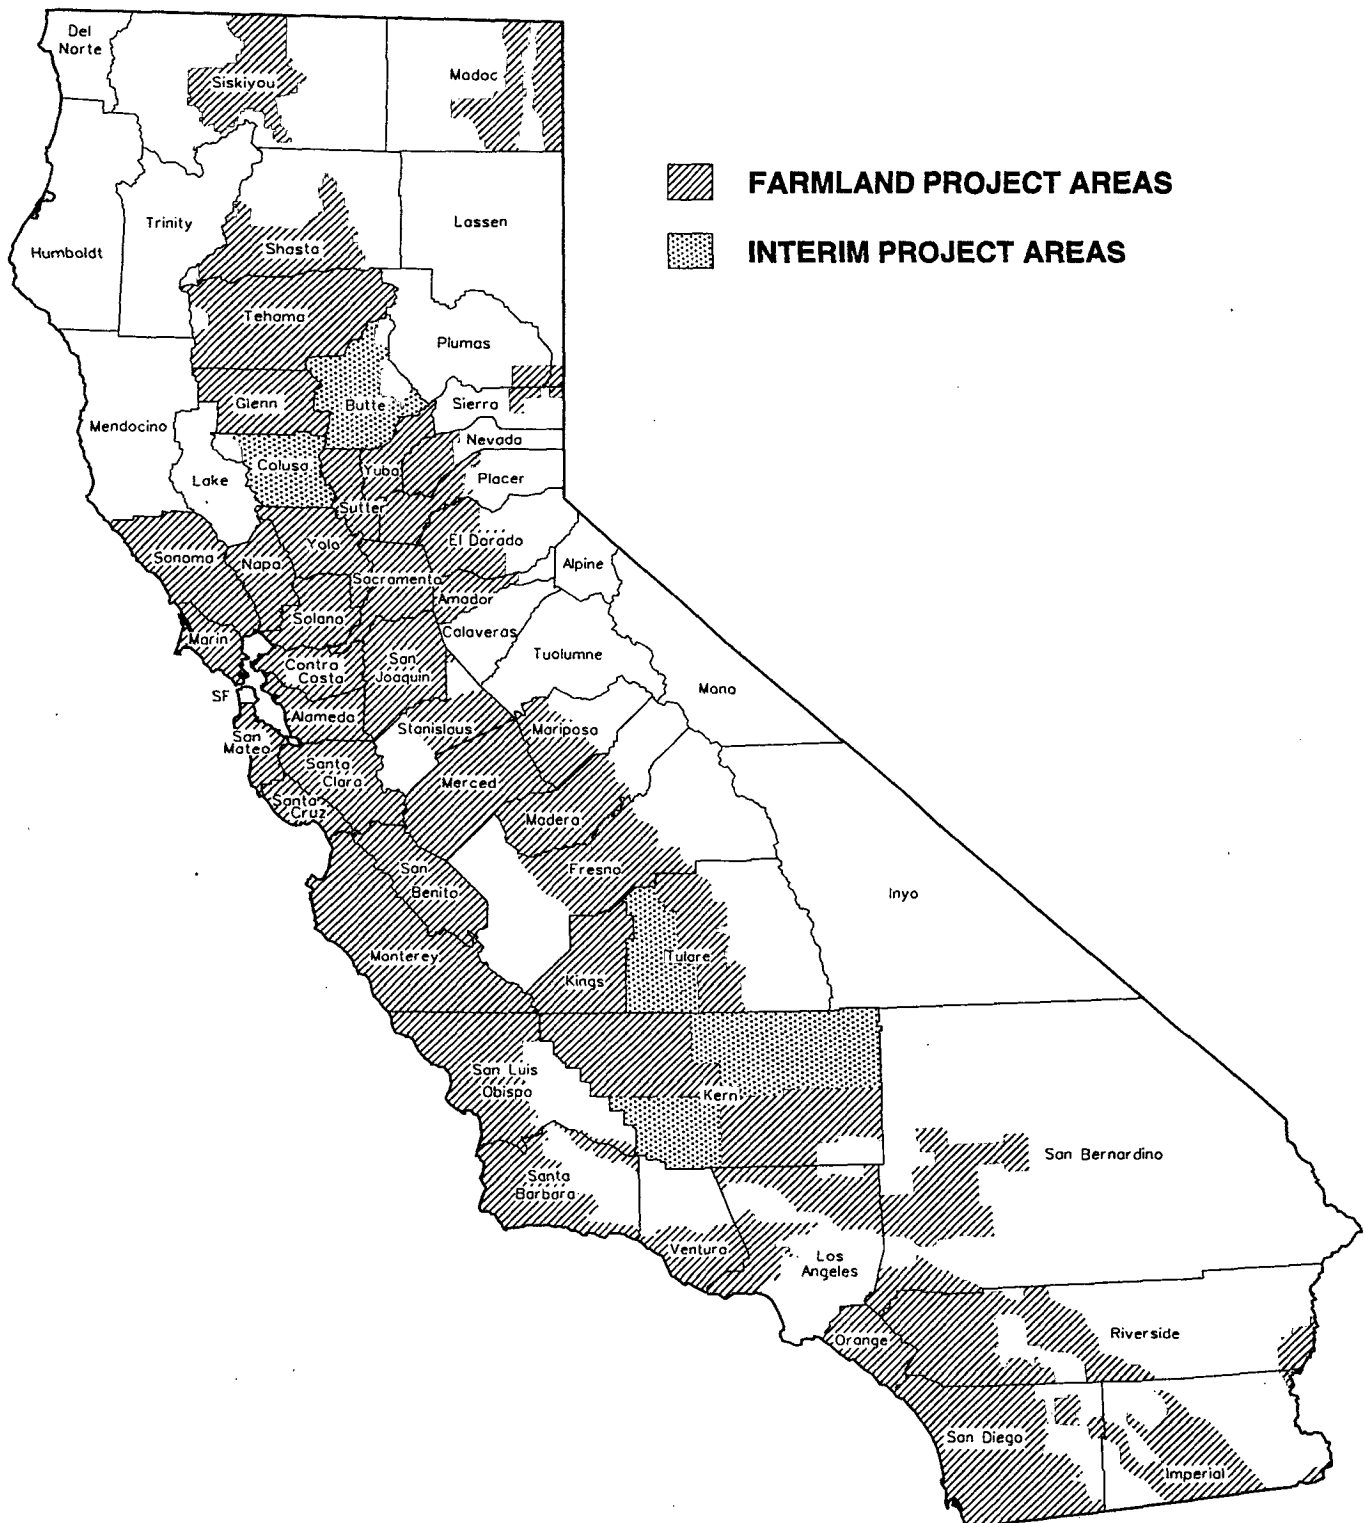

Figure 1. Status of Farmland Mapping, 1994

## **MAPPING CATEGORIES**

The following sections provide a brief description of mapping categories used on the Important Farmland and Interim Farmland maps. A more detailed explanation of the technical parameters which qualify lands to be classified in these categories is contained in the Department of Conservation's publication "A Guide to the Farmland Mapping and Monitoring Program."

### **Important Farmland Map Categories**

Important Farmland maps for California are compiled from USDA-NRCS soil surveys and current land use information using eight mapping categories, generally explained below. The minimum mapping unit for each category is 10 acres unless otherwise noted.

#### **PRIME FARMLAND**

Farmland with the best combination of physical and chemical features able to sustain long term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date.

#### **FARMLAND OF STATEWIDE IMPORTANCE**

Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or with less ability to hold and store moisture. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date.

#### **UNIQUE FARMLAND**

Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include nonirrigated orchards or vineyards as found in some climatic zones in California. The land must have been cropped at some time during the two update cycles prior to the mapping date.

#### **FARMLAND OF LOCAL IMPORTANCE**

Land of importance to the local agricultural economy, as determined by each county's board of supervisors and a local advisory committee. See also Appendix D for each county's definition of Farmland of Local Importance.

#### **GRAZING LAND**

Land on which the existing vegetation is suited to the grazing of livestock. This category is used only in California and was developed in cooperation with the California Cattlemen's Association, the University of California Cooperative Extension Service, and other groups interested in knowing the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres.

#### **URBAN AND BUILT-UP LAND**

Land occupied by structures with a building density of at least one unit to one and one-half acres, or approximately six structures to a ten-acre parcel.

**OTHER LAND**

Land which does not meet the criteria of any other category.

**WATER**

Water areas with an extent of at least 40 acres.

**Interim Farmland Map Categories**

Interim Farmland maps are prepared for specific agricultural counties lacking modern soil surveys. The use of an interim mapping methodology provides a bench mark, or point in time, from which urbanization can be tracked, and also provides a gross view of the status of farmland.

The farmland categories used in these maps are not dependent on modern soil survey information; two categories of Interim Farmland are mapped in lieu of the categories of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance. The two Interim Farmland categories are explained below.

**IRRIGATED FARMLAND**

Cropped land with a developed irrigation water supply that is dependable and of adequate quality. Land must have been used for production of irrigated crops at some time during the two update cycles prior to the mapping date.

**NONIRRIGATED FARMLAND**

Land on which agricultural commodities are produced on a continuing or cyclic basis utilizing stored soil moisture.

The categories of Irrigated Farmland and Nonirrigated Farmland are designed to be easily upgraded to Important Farmland categories as the USDA-NRCS completes modern soil survey mapping and the technical soil information becomes available.

The categories of Grazing Land, Urban and Built-up Land, Other Land, and Water on Interim Farmland maps are identical to those for Important Farmland maps.

Due to a lack of soil surveys for large sections of Kern and Tulare counties, maps for these two counties are a combination of both Important and Interim categories. When modern soil surveys are completed for Interim sections of these counties, they will be fully converted to Important Farmland maps.

**Land Committed to Nonagricultural Use**

This category was developed in cooperation with local government planning departments and county boards of supervisors during the public workshop phase of the FMMP's development in 1982. Land Committed to

Nonagricultural Use (Committed) information is available as an overlay to the standard farmland information.

**LAND COMMITTED TO NONAGRICULTURAL USE**

Existing farmland and grazing land, and vacant areas, which have a permanent commitment for development.

Examples of Committed land would include an area undergoing sanitary sewer installation or for which bonds or assessments have been issued for public utilities. Land Committed to Nonagricultural Use represents a planning area for which there is a commitment for future nonagricultural development which is not reversible by a simple majority vote by a city council or board of supervisors.

The FMMP is mandated to collect Committed information; however, cities and counties are not required to furnish this information and do so on a voluntary basis.

**CHANGES TO MAPPING IN 1994**

Revisions to the list of soils qualifying for Prime Farmland and Farmland of Statewide Importance in Imperial County were forwarded to the FMMP from the USDA-NRCS during the 1994 update. These technical revisions were based on reassessment of the physical characteristics of the Glenbar Complex; Rositas Fine Sand 0-2 percent slopes; Rositas Fine Sand wet; Rositas Loamy Fine Sand 0-2 percent slopes; and Rositas-Superstition Loamy Fine Sand 0-2 percent slopes. These soil mapping units were deleted (downgraded) from the Prime Farmland list and added to the Farmland of Statewide Importance list. This represents a conversion of 9,361 acres of Prime Farmland to Farmland of Statewide Importance as shown on the Imperial County 1992-94 Land Use Conversion Table.

Revisions to the list of soils qualifying for Farmland of Statewide Importance in Sutter County were forwarded to the FMMP from the USDA-NRCS during the 1994 update. These technical revisions were based on reassessment of the physical characteristics of the Galt clay, frequently flooded, 0-2 percent slopes (where irrigated), soil mapping unit. This soil mapping unit was deleted (downgraded) from the Farmland of Statewide Importance list. This represents a conversion of 454 acres of Farmland of Statewide Importance to Unique Farmland as shown on the Sutter County 1992-94 Land Use Conversion Table.

## CHAPTER TWO

---

### SUMMARY AND ANALYSIS

#### EXPLANATION OF TABLES

A summary of acreages in each category for all project counties appears in Tables 1 and 2 for 1992 and 1994, respectively. These tables also indicate the percentage of each county ("Percent Mapped") that is covered by FMMP maps. Figures for "Total County Area" in Tables 1 and 2 are derived from two sources. For the 21 counties where FMMP maps the entire county, "Total County Area" is directly calculated from the digital database of the Important Farmland map itself. In counties which are partially mapped, "Total County Area" is determined from the California Regional Framework Study figures compiled by the California Department of Finance. Areas that are not mapped by the project typically do not have modern soil surveys, are large public land holdings, or do not contain significant agricultural land uses.

Table 3 represents the summary of all Important Farmland conversions between 1992 and 1994. It is a summation of the individual county tables in Appendix A (A-1 through A-41, A-44, and A-46). Table 3 does not include conversions for the Interim map sections of Butte, Colusa, Kern, and Tulare counties.

The components of Table 3 and the individual County Land Use Conversion Tables are:

**Part I** lists acreage figures by category and shows gains, losses, and net changes from 1992 to 1994.

**Part II** lists acreage for cities and counties which elected to report on Land Committed to Nonagricultural Use. Not all project counties reported information for this table, and in some cases, information was reported for only one of the years inventoried. Data for Part II represents a cumulative total of reported acreage minus any acres that have already become urbanized.

**Part III** reports the amount of acreage converted from one land use category to another. Conversion data is determined on a category-to-category basis; eight categories and 56 conversion combinations are reported regarding land use change in areas mapped for Important Farmland maps. Similarly, six categories and 30 conversion combinations are reported for areas mapped for Interim Farmland maps.

## **ASSUMPTIONS IN ANALYSES**

The analyses of conversion data in this chapter are compiled from Part III of all tables in Appendix A, including the four Interim counties. The integration of Important and Interim Farmland figures in the project-wide and regional analyses result in larger conversion numbers than can be seen in Table 3 alone. The figures can be seen by region in the Regional Conversion Summary (Appendix B).

To facilitate general analyses, grouping of Important and Interim Farmland categories has been conducted and certain simplifying assumptions have been made. For example, Unique Farmland is considered to be an irrigated farmland category in these analyses; even though a small proportion of land within the Unique category supports high value nonirrigated crops, such as coastal vineyards. Conversely, Farmland of Local Importance is considered to be a nonirrigated category although it also supports some irrigated pastures on non-Prime and non-Statewide Important soils.

## **STATISTICAL NOTES**

### **Area Calculations**

Processing methods developed during computation of the 1992-94 conversion statistics have, for some counties, produced more accurate area calculations. As a result, some 1992 acreage data in this report may be different, and more accurate, than those published in the 1990-92 conversion report. This is part of a continuing effort by the Department of Conservation to improve analytic procedures and products.

### **Residual Polygons**

The minimum mapping unit for all farmland categories, Other Land, and Urban and Built-up Land is 10 acres. For Grazing Land and Water the minimum mapping unit is 40 acres. Small residual polygons less than the minimum mapping unit are sometimes created during the map updating process. These residual polygons are too small to be shown on the Important and Interim Farmland maps, and are therefore combined with the most appropriate adjacent land use type on the map. These changes are statistically tabulated during computer processing and are reported as small conversions in the final land use conversion tables.

Notes to the Reader:

- "County Area Inventoried" represents those portions of counties covered by USDA-NRCS soil surveys and mapped by the Farmland Mapping and Monitoring Program.
- Lassen, Plumas, and Sierra counties are included within the tri-county area referred to as "Sierra Valley" in the USDA-NRCS soil survey for that region.

Notes to the Reader:

- "County Area Inventoried" represents those portions of counties covered by USDA-NRCS soil surveys and mapped by the Farmland Mapping and Monitoring Program.
- Lassen, Plumas, and Sierra counties are included within the tri-county area referred to as "Sierra Valley" in the USDA-NRCS soil survey for that region.

1994 ACREAGE SUMMARY

## PROJECT-WIDE CONVERSION SUMMARY

The rate of urbanization in the FMMP project area during 1992-94 was 44,957 acres less than the previous reporting period. During 1992-94 there were 54,307 acres of new urban land developed, compared to 99,264 new urban acres during 1990-92. This represents a decrease in the urbanization rate of 45 percent between the two update cycles. This decreasing rate of development was observed on farmland as well as on marginal lands (Figure 2). New development on areas previously classified as Other Land declined by nearly 25,000 acres compared to 1990-92, while development from Farmland of Local Importance, Grazing Land, and Nonirrigated Land categories declined by almost 11,600 acres. Urbanization of irrigated farmland categories decreased from 23,599 acres in 1990-92, to 15,098 acres in 1992-94. (Please see statistical note under Program Background in Appendix C.)

There was a net decrease of 70,361 acres in irrigated farmland between 1992 and 1994, compared with the 62,442 acre loss reported in the previous update (Figure 3). This "net loss" represents a 0.8 percent decline from the 8.98 million irrigated acres mapped by the FMMP in 1992.

Notes to the Reader:

1. This table includes acreage data for 45 counties. Conversion data for counties mapped using Interim Farmland categories (Butte, Colusa, portions of Kern and Tulare counties) are not included.
2. Figures for "Net Acreage Changed" in Part I and for conversions between the Prime Farmland, Farmland of Statewide Importance, and Unique Farmland categories in Part III, are partially due to technical revisions to the lists of soils qualifying for Prime Farmland and Farmland of Statewide Importance. See text for further details.

**CONVERSION SUMMARY**

Aside from urbanization, irrigated farmland conversion occurred due to cessation of irrigation or agricultural production, conversions to wetland habitat, low density "ranchette" developments, gravel mining operations, and the development of confined livestock facilities.

Many acres of irrigated farmland which had been left idle since 1990 as a result of market or water supply issues, drainage and salinity problems, or other economic issues, were removed from irrigated categories during the 1994 update. Field mappers identified these idle lands for two update cycles (1990 and 1992) before removing them from irrigated categories in 1994. This procedure is used to minimize the effects of crop rotation cycles that leave the land fallow for a number of seasons. Should any of this land become irrigated in the future, it will be shown as a conversion to irrigated farmland.

Prime Farmland, with the best physical and chemical characteristics for agricultural production, accounted for more than 62 percent of the net irrigated farmland losses in 1992-94, or 43,904 acres. Between 1990 and 1992, Prime

Farmland accounted for approximately 40 percent of the irrigated farmland loss. More than half of the net loss to Prime Farmland was conversion to Farmland of Local Importance, primarily because the land had been withdrawn from irrigation or the land had been left idle for three update cycles. More details on these changes can be seen in the individual county tables and the following regional analysis.

## **REGIONAL CONVERSION SUMMARY AND RANKING**

The FMMP project counties were aggregated into seven regions based on climate and geography to examine the relative amount of change in different parts of the state. The most important types of conversion were summarized for each region and are shown in Appendix B.

The Southern California Region continues to be the most active in terms of overall urbanization, with 25,972 acres (48 percent) of new urban land (Table 4). About 17 percent of new urban land in this region was located on irrigated farmland, with the remainder coming from areas of native vegetation, dryland farming, and grazing. The Region had a net loss of almost 24,000 acres of irrigated farmland from 1992 to 1994, which was more than twice the amount of irrigated land lost between 1990-92.

The San Joaquin Valley Region, although second in overall urbanization (13,398 acres or 25 percent), ranked first in conversion of irrigated farmland. A total of 6,869 new urban acres occurred on irrigated farmland in this region, which is a reduction from the 10,734 acres reported in the 1990-92 update. The Southern California Region ranked second in the conversion of irrigated farmland to urban land, with 4,413 acres.

While the San Joaquin Valley Region led the state in net loss of irrigated farmland with 25,152 acres, the region's loss in farmland was far less than the 50,995 acres lost between 1990-92. Conversely, Southern California's loss of 23,848 acres in 1992-94 was substantially higher than the 11,911 acres lost between 1990-92.

The San Francisco Bay Region accounted for 5,824 acres (11 percent) of new urban land in the project area, ranking third in overall urbanization. Its growth rate was significantly lower than the 13,863 acres reported in the previous update cycle. About 24 percent of the new urban land in the Bay Region occurred on irrigated farmland.

In the Sacramento Valley Region urban expansion totaled 5,290 acres, down from 10,636 acres in the previous reporting cycle. The source of 67 percent of 1992-94 new urban land was from nonirrigated farmland, grazing land, native vegetation, and other marginal land uses. There was an overall net loss of

11,030 acres of irrigated land in the region in the current reporting period compared to 7,920 acres in 1990-92.

Three other regions constitute the remainder of the state: Central Coast, Northeastern, and Sierra Foothill. Together they accounted for 7 percent (3,823 acres) of all new urban land. The Central Coast Region had the largest number of new urban acres (2,048), compared to the growth of 2,893 acres the region experienced between 1990-92. The Sierra Foothill Region experienced about half the urban growth seen in the previous reporting period, with 1,614 acres in 1992-94 versus 3,486 acres of new urban in 1990-92. The counties of the Northeastern Region have had less than 200 acres of development meeting urban density criteria in each of the last two updates.

Only the Northeastern Region had a net increase in irrigated land. The region gained 2,874 new acres of irrigated land, primarily in Modoc County. The 1992-94 update marked the first time comprehensive and current air photography was available for Modoc County. The new photographs allowed for identification of some land uses which may have actually been in existence since the late 1980's. The rural nature of this county afforded little opportunity for modern air photography, therefore, field reconnaissance has had to be relied on more heavily in the past.

**Notes to Reader:**

- (1) FMMP project counties are grouped into regions as shown in Appendix B. Figures for 1992-1994 include conversion information for western Merced County (San Joaquin Valley Region) which was added to the FMMP project area in 1992.
- (2) For this analysis, irrigated categories include Prime Farmland, Farmland of Statewide Importance, and Unique Farmland on Important Farmland maps; and Irrigated Farmland on Interim Farmland maps.
- (3) For this analysis, nonirrigated categories include Grazing Land, Other Land, and Farmland of Local Importance on Important Farmland maps; and Grazing Land, Other Land, and Nonirrigated Farmland on Interim Farmland maps.

**COUNTY CONVERSION SUMMARY AND RANKING**

The current reporting period shows that the counties leading the state in urbanization of irrigated land were in the San Joaquin Valley and Southern California regions (Table 5). Kern County led the state in having the most irrigated farmland converted to urban land, with 2,279 acres. Riverside County was second with 1,643 acres. Fresno, San Joaquin and Ventura

counties followed in order, but each had less than 900 acres of irrigated farmland converted to urban land.

Southern California counties once again led the list of top 10 urbanizing counties during 1992-94, with 25,270 acres newly developed for urban uses. Ventura and Santa Clara counties were added to this list, while Contra Costa and Fresno counties dropped off. Riverside County led the list with 8,435 acres, down from 10,846 acres in 1990-92. Riverside's growth was chiefly new housing subdivisions, with much building activity in the Corona, Lake Elsinore, Sunnymead, and Perris Valley area, as well as Del Webb's Sun City near Palm Springs. San Bernardino County dropped from 13,745 new urban acres during 1990-92 to only 4,710 acres in 1992-94. Development in this county was widespread, from Victorville in the north to Yucaipa in the south, and consisted of new homes, condominiums, as well as commercial and light industry.

Other Southern California counties also had declining growth rates, with San Diego dropping 53 percent and Imperial dropping 66 percent over the previous reporting period. Ventura County's increased urbanization was the result of various developments throughout the county, but housing in the Oxnard area, a new landfill and a golf course were some primary examples. Santa Clara County's addition to the top 10 urbanizing list was primarily due to new housing developments, condominiums, and a new golf course community near San Jose.

Kern County gained 3,619 acres of urban land between 1992 and 1994, about half as much as the county experienced between 1990 and 1992. Most of this development consisted of new homes and water control structures.

The counties with the greatest net loss of irrigated farmland were Kern, Riverside and San Benito. In addition to new housing development, much of the farmland converted in these counties was due to land lying fallow for six years.

Net gains in farmland were relatively small and concentrated in central and northern California. Modoc, Stanislaus and Sonoma counties each had net gains. Modoc County's gains, as noted above, were mainly due to new irrigated alfalfa and pastures; Stanislaus saw various amounts of new irrigated agriculture, including pasture and vineyards; while Sonoma County's new cropland was primarily vineyards, orchards, and some row crops. About 60 percent of the net irrigated farmland gains in these counties qualified for Prime Farmland while the remainder was Farmland of Statewide Importance and Unique Farmland.

### LAND COMMITTED TO NONAGRICULTURAL USE

Counties and cities may voluntarily submit documentation to the FMMP on Land Committed to Nonagricultural Use. This information is then made available as an overlay to the existing land use data. To date, jurisdictions in 35 of the 47 project counties have submitted information for this category.

Because the information is voluntarily submitted, includes areas which will change over a long time period, and includes both low- and high-density developments, Land Committed to Nonagricultural Use (Committed) can only be seen as a general indication of expected urbanization trends.

Among the jurisdictions submitting Committed data, a total of 163,265 acres are slated for nonagricultural uses in the future (Table 6). Of these lands, 17 percent (27,230 acres) are currently mapped as Prime Farmland by the FMMP, and 7 percent (11,662 acres) are within other irrigated categories. Approximately 76 percent of the Committed Land (124,373 acres) is currently

mapped as Farmland of Local Importance, Nonirrigated Farmland, Grazing Land, and Other Land.

These figures represent a 9 percent increase in Committed Land compared to those reported for the 1990-92 period. Committed Land located on Prime Farmland increased by 30 percent during the previous reporting period, and overall irrigated farmland Committed to Nonagricultural use rose by 26 percent.

**TABLE 6**

Notes to the Reader:

1. Conversion to Farmland of Statewide Importance reflects Natural Resources Conservation Service transfer of Glenbar Complex, Rositas Fine Sand 0-2% slopes, Rositas Fine Sand wet, Rositas Loamy Fine Sand 0-2% slopes, and Rositas-Superstition Loamy Fine Sand 0-2% slopes from the list of soils qualifying for Prime Farmland.
2. Conversion to Farmland of Local Importance primarily due to land left idle for three update cycles.

Notes to the Reader:

1. 1992 acreages vary from those listed in the 1990-1992 Farmland Conversion Report due to improved computer processing methods.
2. Conversion to Grazing Land primarily due to land left idle for three update cycles.
3. Conversion to Other Land due to low density rural residential development on the Ahwahnee quadrangle; and for experimental range expansion on the O'Neals quadrangle.

Notes to the Reader:

1. Conversion to Unique Farmland due to corrections made to soil unit identification on the Arena and San Luis Ranch quadrangles.
2. Conversion to Prime Farmland due to corrections made to soil unit identification on the Plainsburg, Santa Rita Bridge, and Ortigalita Peak NW quadrangles.
3. Conversion to Grazing Land primarily due to land left idle for three update cycles.

Notes to the Reader:

1. Conversion among agricultural categories and Grazing Land is due to two reasons. Primarily, accumulated land use changes were detected on 1995 air photos which covered the entire survey area. In many prior map updates, photo coverage was limited or unavailable, such that updates were based solely on public comment and field reconnaissance. Secondly, corrections were made to soil unit identification in the Surprise Valley.
2. Conversion to Grazing Land due to reevaluation of soil units qualifying for Farmland of Local Importance.
3. Conversion to Other Land primarily due to establishment of wildlife and wetland habitat near the Goose Lake and Alkali Lake areas.

Notes to the Reader:

1. Conversion to Unique Farmland due to nurseries with potted plants on the Newport Beach, Tustin, and El Toro quadrangles.
2. Conversion to Water Area due to boundary adjustments along Walnut Canyon Reservoir and Oso Creek.

Notes to the Reader:

1. Conversion to Farmland of Local Importance primarily due to land left idle for three update cycles.
2. Conversion to Other Land partially due to areas in the Coachella Valley lacking a history of agricultural use and reevaluation of the Farmland of Local Importance category.
3. Conversion to Farmland of Local Importance and Other Land due to abandoned golf course.

Notes to the Reader:

1. Conversion to Prime Farmland due to corrections made to soil unit identification on the Morgan Hill quadrangle.
2. Conversion to Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Other Land due to identification of agricultural uses within urban boundary and gravel pit reclamation southwest of Monta Vista.

Notes to the Reader:

1. Conversion to Farmland of Local Importance primarily due to land left idle for three update cycles.
2. Conversion to Farmland of Local Importance and Grazing Land primarily due to land left idle for three update cycles.
3. Conversion to Grazing Land primarily due to long term fallowing of dryfarmed areas in the foothills and along the Yolo Causeway.

## REGIONAL CONVERSION SUMMARY

## **APPENDIX C**

---

### **FARMLAND MAPPING AND MONITORING PROGRAM**

#### **GOALS AND OBJECTIVES**

The primary goal of the Department of Conservation's Farmland Mapping and Monitoring Program (FMMP) is to provide land use conversion information for decision makers to use in their planning for the present and future of California's agricultural land resources. To meet this goal, the FMMP provides maps and statistical data to the public, academia, and local, state, and federal governments. A secondary goal of FMMP is to continue to increase its mapping inventory area as information from newly compiled USDA-NRCS soil surveys become available

The FMMP and its activities are authorized by Government Code Section 65570. This section mandates the FMMP to biennially report to the Legislature, by July 1 of even-numbered years, on the conversion of farmland and grazing land; and to provide maps and data, by August 1, to local governments and the public. The FMMP is also mandated to prepare and maintain an automated mapping and data base system (Geographic Information System) to record and report changes in the use of agricultural lands.

The FMMP continues to improve its mapping through its map review process, through the use of current air photography and the adoption of newly available mapping resources (digital imagery, digital base maps, and other data layers), and through improved computer processing methods.

#### **PROGRAM BACKGROUND**

The FMMP was established in 1982 to continue the Important Farmland mapping efforts started in 1975 by the U.S. Department of Agriculture, Natural Resources Conservation Service (USDA-NRCS). The intent of the USDA-NRCS was to produce agricultural resource maps based on soil quality and land use across the nation. As part of this mapping effort, the USDA-NRCS developed a series of definitions known as the Land Inventory and Monitoring (LIM) criteria.

The LIM criteria classified the land's suitability for agricultural production based on physical and chemical characteristics of soils and actual land use. Important Farmland maps are derived from USDA-NRCS soil survey maps using LIM criteria.

The USDA-NRCS intended to complete a nationwide set of Important Farmland maps. However, in 1980, a decreasing federal priority for completing the LIM mapping program influenced the State of California to assist the USDA-NRCS with completing its mapping in California. State efforts at that time were directed at providing assistance to the federal government to expedite completion of draft Important Farmland maps for California. In 1982, the FMMP was created within the Department of Conservation to carry on the mapping activity on a continuing basis and with a greater level of detail.

It was the intent of the Legislature and a broad coalition of building, business, government, and conservation interests that the FMMP be nonregulatory, and provide a consistent and impartial analysis of agricultural land use and land use change throughout California. With this in mind, the FMMP provides the basic data from which observations, analyses, and decisions can be made in the land use planning process.

A brief look at the legislative record highlights important events and changes in the history and direction of the FMMP.

- **ASSEMBLY BILL 966 (Lehman), Chapter 13, Statutes of 1982**, established the FMMP to map, monitor, and report on important farmland, grazing land, and urban areas in counties with modern soil surveys. This legislation also required the FMMP to prepare and maintain an automated database.
- **SENATE BILL 946 (Vuich), Chapter 1342, Statutes of 1985**, authorized use of an interim mapping methodology in counties lacking modern soil surveys, and authorized addition and mapping of new counties as modern soil surveys are completed.
- **ASSEMBLY BILL 3719 (Costa), Chapter 1053, Statutes of 1986**, shifted the FMMP from an annual to a biennial update cycle.
- **SENATE BILL 642 (Garamendi), Chapter 1308, Statutes of 1987**, incorporated the Farmland Mapping Account with that of the Soil Conservation Program into a common fund as part of the state's Soil Conservation Fund.

Map updating was shifted to a two-year, or biennial, update cycle in 1986. This allowed map updating to begin in the first year of the cycle with computer

processing, data analysis, and the generation of a Farmland Conversion Report in the second year, documenting each cycle.

Statistical Note: Conversion statistics developed by the FMMP represent land use changes mapped in 47 of California's 58 counties. Several important agricultural regions are not included in the FMMP inventory (e.g., western Stanislaus and western Fresno counties, eastern Siskiyou County, Lake County, and the Owens-Benton Valley of Inyo and Mono counties), because there is either no modern soil survey available for the area or the soil survey has just recently been published. Independent studies of land use conversion by federal, state, and county governments, by the University of California, or by non-profit organizations, may develop conversions statistics different from those cited in this report. The differences which result in other published studies are due to study-specific definitions of "farmland," "agricultural land," and "cropland," as used by the various agencies, and due to various methodologies used for conversion projections some studies develop for areas not physically mapped or surveyed. Time periods for which land use change statistics are tracked also vary significantly with different analyses.

Further information on the FMMP mapping procedures and detailed farmland map category definitions are available in the publication A Guide to the Farmland Mapping and Monitoring Program.

## **APPENDIX D**

---

### **FARMLAND OF LOCAL IMPORTANCE DEFINITIONS**

Farmland of Local Importance is land of importance to the local economy, as defined by each county's local advisory committee and adopted by its Board of Supervisors. Farmland of Local Importance is either currently producing, or has the capability of production, but does not meet the criteria of Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. Authority to adopt or to recommend changes to the category of Farmland of Local Importance rests with the Board of Supervisors in each county.

#### **ALAMEDA**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Alameda County.

#### **AMADOR**

Land that is currently in agricultural production and that is providing an economic return equal to that from the prime soil types.

#### **CONTRA COSTA**

The lands within the Tassajara area, extending eastward to the county boundary and bordered on the north by the Black Hills, the Deer, Lone Tree and Briones Valleys, the Antioch area, and the Delta. These lands are typically used for livestock grazing. They are capable of producing dryland grain on a two year summer fallow or longer rotation with volunteer hay and pasture. The farmlands in this category are included in the U.S. Natural Resources Conservation Service's Land Capability Classes I, II, III, and IV, and lack some irrigation water.

#### **EL DORADO**

Lands that do not qualify for the Prime, Statewide, or Unique designation but are considered Existing Agricultural Lands, or Potential Agricultural Lands, in the Agricultural Land Element of the County General Plan. Timberlands are excluded.

## **FRESNO**

All farmable lands within Fresno County that do not meet the definitions of Prime, Statewide, or Unique.

## **GLENN**

Local Importance (L): All lands not qualifying for Prime, Statewide, or Unique that are cropped on a continuing or cyclic basis (irrigation is not a consideration). All cropable land within Glenn County water district boundaries not qualifying for Prime, Statewide, or Unique.

Local Potential (LP): All lands having Prime and Statewide soil mapping units which are not irrigated, regardless of cropping history or irrigation water availability.

## **IMPERIAL**

Unirrigated and uncultivated lands with Prime and Statewide soils.

## **KERN**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Kern County.

## **KINGS**

Land that supports the following commercial agricultural activities: dairies, confined livestock, and poultry operations.

## **LOS ANGELES**

Producing lands that would meet the standard criteria for Prime or Statewide but are not irrigated.

## **MADERA**

Lands that are presently under cultivation for small grain crops, but are not irrigated. Also lands that are currently irrigated pasture, but have the potential to be cultivated for row/field crop use.

## **MARIN**

Land which is not irrigated, but is cultivated; or has the potential for cultivation.

**MARIPOSA**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Mariposa County.

**MERCED**

Farmlands that have physical characteristics that would qualify for Prime or Statewide except for the lack of irrigation water. Also, farmlands that produce crops that are not listed under Unique but are important to the economy of the county or city.

**MODOC**

Irrigated and dry cropland classified as Class III and Class IV irrigated land if water is or becomes available.

**MONTEREY**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Monterey County.

**NAPA**

These farmlands include areas of soils that meet all the characteristics of Prime Farmland or of additional Farmland of Statewide Importance with the exception of irrigation. These farmlands include dryland grains, haylands, and dryland pasture.

**NEVADA**

Farmlands that have physical characteristics that would qualify for Prime or Statewide except for the lack of irrigation water. Farmlands that produce crops that are not listed under Unique Lands but are important to the economy of the county are: Christmas trees, Sudan grass, Meadow hay, chestnuts, poultry houses and feedlots, improved dryland pasture (not rangeland), and irrigated pasture (it is under Statewide or Prime if soils are listed as such, otherwise as Local).

Also, lands that are legislated to be used only for agricultural (farmland) purposes, such as Williamson Act land in western Nevada County.

## **ORANGE**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Orange County.

## **PLACER**

Farmlands not covered by the categories of Prime, Statewide, or Unique. They include lands zoned for agriculture by County Ordinance and the California Land Conservation Act as well as dry farmed lands, irrigated pasture lands, and other agricultural lands of significant economic importance to the County and include lands that have a potential for irrigation from Placer County water supplies.

## **RIVERSIDE**

Soils that would be classified as Prime and Statewide but lack available irrigation water. Lands planted to dryland crops of barley, oats, and wheat.

Lands producing major crops for Riverside County but that are not listed as Unique crops. These crops are identified as returning one million or more dollars on the 1980 Riverside County Agriculture Crop Report. Crops identified are permanent pasture (irrigated), summer squash, okra, eggplant, radishes, and watermelons.

Dairylands, including corrals, pasture, milking facilities, hay and manure storage areas if accompanied with permanent pasture or hayland of 10 acres or more.

Lands identified by city or county ordinance as Agricultural Zones or Contracts, which includes Riverside City "Proposition R" lands. Lands planted to jojoba which are under cultivation and are of producing age.

## **SACRAMENTO**

Lands which do not qualify as Prime, Statewide, or Unique designation but are currently irrigated crops or pasture or nonirrigated crops; lands that would be Prime or Statewide designation and have been improved for irrigation but are now idle; and lands which currently support confined livestock, poultry operations, and aquaculture.

**SAN BENITO**

Land cultivated as dry cropland. Usual crops are wheat, barley, oats, safflower, and grain hay. Also, orchards affected by boron within the area specified in County Resolution Number 84-3.

**SAN BERNARDINO**

Farmlands which include areas of soils that meet all the characteristics of Prime, Statewide, or Unique and which are not irrigated.

Farmlands not covered by above categories but are of high economic importance to the community. These farmlands include dryland grains of wheat, barley, oats, and dryland pasture.

**SAN DIEGO**

Land that meets all the characteristics of Prime and Statewide, with the exception of irrigation.

Farmlands not covered by the above categories but are of significant economic importance to the county. They have a history of good production for locally adapted crops. The soils are grouped in types that are suited for truck crops (such as tomatoes, strawberries, cucumbers, potatoes, celery, squash, romaine lettuce, and cauliflower) and soils suited for orchard crops (avocados and citrus).

**SAN JOAQUIN**

All farmable land within San Joaquin County not meeting the definitions of "Prime Farmland," "Farmland of Statewide Importance," "Unique Farmland," or "Grazing Land." This includes land that is or has been used for irrigated pasture, dryland farming, confined livestock or dairy facilities, aquaculture or poultry facilities. It also includes soils previously designated by soil characteristics as "Prime Farmland," "Farmland of Statewide Importance," and "Unique Farmland" that has since become idle.

**SAN LUIS OBISPO**

Local Importance (L): areas of soils that meet all the characteristics of Prime or Statewide, with the exception of irrigation. Additional farmlands include dryland field crops of wheat, barley, oats, and safflower.

Local Potential (LP): lands having the potential for farmland, which have Prime or Statewide characteristics and are not cultivated.

## **SAN MATEO**

Lands other than Prime, Statewide, or Unique that produce the following crops: oats, Christmas trees, pumpkins, dryland pasture, other grains, and haylands. These lands are not irrigated.

## **SANTA BARBARA**

All dryland farming areas and permanent pasture (if the soils were not eligible for either Prime or Statewide). Dryland farming includes various cereal grains (predominantly wheat, barley, and oats), sudan, and many varieties of beans. (Although beans can be high value crops the production areas are usually rotated with grain, hence the decision to include them under Local rather than Unique. Also, bean crop yields are highly influenced by climate, so there can be a wide variance in cash value.)

## **SANTA CLARA**

Small orchards and vineyards primarily in the foothill areas. Also land cultivated as dry cropland for grains and hay.

## **SANTA CRUZ**

Soils used for Christmas tree farms and nurseries, and that do not meet the definition for Prime, Statewide, or Unique.

## **SHASTA**

Dryland grain producing lands. Also included are farmlands that are presently irrigated but do not meet the soil characteristics of Prime or Statewide. The majority of these farmlands are located within the Anderson Cottonwood Irrigation District. These soils include Newton gravelly loam (8 to 15 percent slopes), Moda loam, seeped (0 to 3 percent slopes), Moda loam, shallow (0 to 5 percent slopes), and Hillgate loam.

## **SIERRA VALLEY**

Plumas County: Lands designated as "agricultural preserve" in the 1984 Plumas County General Plan and rangelands with a carrying capacity of 8 acres/animal month, as well as irrigable lands.

Lassen and Sierra counties: Farmlands that include areas of soils that meet all the characteristics of Prime or Statewide and which are not irrigated. Also, all dry land wheat, barley, oats, hayland, and pasture.

## **SISKIYOU**

Farmlands that include dryland or sub-irrigated hay and grain and improved pasture forage species. These dry farmed lands commonly have inclusions of uncultivated shallow, rocky, or steep soils.

Also included are farmlands presently irrigated but which do not meet the soil characteristics of Prime or Statewide.

## **SOLANO**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Solano County.

## **SONOMA**

The hayland producing areas of the Santa Rosa Plains, Petaluma Valley, and Tubbs Island Naval Reservation. Additional areas also include those lands which are classified as having the capability for producing locally important crops such as grapes, corn, etc., but may not be planted at the present time.

Examples of these areas include the coastal lands from Fort Ross to Stewarts Point, areas surrounding Bloomfield, Two Rock, Chileno Valley, and areas of Sonoma Valley in the vicinity of Big Bend, Vineburg, and Schellville.

## **STANISLAUS**

Farmlands growing dryland pasture, dryland small grains, and irrigated pasture.

## **SUTTER**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Sutter County.

## **TEHAMA**

All lands which are not included in Prime, Statewide, or Unique and are cropped continuously or on a cyclic basis (irrigation is not a factor). Also, all lands included in the L category which have soil mapping units listed for Prime or Statewide and which are not irrigated.

## **TULARE**

Lands that produce dryland grains (barley and wheat); lands that have physical characteristics that would qualify for "Prime" or "Statewide Important" farmlands except for the lack of irrigation water; and lands that currently support confined livestock, poultry, and/or aquaculture operations.

## **VENTURA**

Soils that are listed as Prime or Statewide that are not irrigated, and soils growing dryland crops--beans, grain, dryland walnuts, or dryland apricots.

## **YOLO**

Local Importance (L): cultivated farmland having soils which meet the criteria for Prime or Statewide, except that the land is not presently irrigated, and other nonirrigated farmland.

Local Potential (LP): Prime or Statewide soils which are presently not irrigated or cultivated.

## **YUBA**

The Board of Supervisors determined that there will be no Farmland of Local Importance for Yuba County.
